The Integrated Biomedical Science Program

Ph.D. in Biomedical Sciences

Re-envisioned Program Request

May 25, 2012
The Integrated Biomedical Science Graduate Program (IBGP) Graduate Studies Committee (GSC) voted to change the name of the IBGP to Biomedical Sciences. The motivation of this change in program name is to simplify, to avoid confusing acronyms for recruiting, and to avoid confusion with other Ph.D. programs in the life sciences at OSU (the IGPs). The term “integrated” remains central to our educational philosophy, and it is implicit in the new name.

Goals of changes to the program

1. To change the curriculum in order to keep pace with the evolving nature of biomedical sciences research.

2. To decrease classroom time and increase research time. The overall approach is best summarized as active learning. We will survey the breadth of biomedical sciences and teach the students how to find things (how to dig deep) on their own. We will not spoon-feed biomedical concepts that will evolve and become outdated.

3. Students interested in certain subdisciplines have not been successfully recruited to IBGP due to the inflexibility of our curriculum. As an example, computational biology students are not interested in the extended classroom time in the core modules learning details of developmental biology or pharmacology. Other subspecialties are similarly losing good applicants to other schools that do not demand this extensive classroom experience. We are shifting from an emphasis on breadth to an emphasis on depth.

4. To give the OSU IBGP a competitive advantage in recruitment – a hardworking student can achieve a PhD in 4 years due to reduced classroom time and increased emphasis on discoveries in research. When choosing among different
schools, we believe that the possibility of a PhD program that takes fewer years could be decisive for an applicant.

Summary of proposed changes:

The proposed changes will increase the laboratory research experience for our students and streamline the didactic experience while minimizing the loss in breadth. The Biomedical Sciences student under this curriculum will have intensive training in identifying research questions, participating in evaluation of research, and in analytic thinking.

1. The full year module course will now be available as an elective. The 12 modules have been independently assigned course numbers in the semester system.

2. To replace the first year modules, we propose a new survey/concept course (approved course IBGP 7000 Biomedical Sciences Survey). (Description of IBGP 7000 is attached in Appendix A.) The overall strategy is for the faculty to summarize broad areas of research and choose specific areas to go into depth. This course goes hand-in-hand with changes in IBGP 7040 (see point 3).

3. The course, IBGP 7040 Research Problem Solving in Biomedical Science, will be changed from 2 semester hours to 4 semester hours. The course description is attached (Appendix B). This class will be required for all first year IBGP students and offered in the spring semester. This is a key component of the active learning process. This change in the course has been approved by the OSU Curriculum Committee. This course will analyze the research literature across the breadth of Biomedical Sciences.

4. The Grant Writing course (IBGP 7070 and 7080), Biostatistics (PUBHBIO 607), Research Techniques (IBGP 8050), and Ethics (PHARM 7510) will remain required. All other courses are now electives.

5. A minimum of 10 semester hours in elective courses are required.

Comparison of old IBGP curriculum with new Biomedical Sciences curriculum

A table is attached (Appendix C) that compares the old curriculum to the proposed curriculum.
IBGP 7000: The key change is the elimination of the requirement to take IBGP 7010 and 7020 (20 credits total), and replacing this required course with IBGP 7000 (6 credits). IBGP 7010/7020 is a collection of 12 modules that have been at the heart of the “integrated” program since the modules start from DNA, continue through cell biology, and then eventually teach the biology of complex organisms and human disease. The new IBGP 7000 will teach these same integrated curriculum, but redundancies will be reduced compared to the module based courses. The module based courses also spoon-feed facts to the students that are rapidly becoming outdated. In the current internet era, facts are at the students’ fingertips; the new IBGP 7000 will teach concepts and rely on the students to learn the facts out of the classroom. It is a more demanding approach, and we expect our students to mature as scientists more rapidly.

IBGP 7040: The Research Problem Solving course is required and is increased from 2 to 4 credit hours. A course description is attached (Appendix B). This teaches the research process each week by analyzing current research papers. The subject of the papers will cover the range of topics in IBGP 7000. This course is participatory and demanding, encouraging our students to discuss the scientific literature as mature scientists do.

IBGP 7930: Individual Studies in Integrated Biomedical Sciences. These are research rotations. We propose to change the minimum number of research rotations from 3 to 2. This results in a decrease in credit hours from 18 to 12 and which is more than offset by the increase in credits in dissertation research.

IBGP 8999: Research in Integrated Biomedical Sciences. This is dissertation research. What will distinguish our students are the discoveries they make as part of their dissertation research. The reductions in classroom time are targeted at rapidly maturing our students as researchers and then providing time in the laboratory to focus on research. We believe that this will result in more research publications per student and a faster time to degree.
Elective Courses: Rather than stipulate which senior level seminar courses Biomedical Sciences students must take, the proposed program will require a minimum of 10 credits of electives. The Biomedical Sciences program offers 37 electives (Appendix D), and students may choose electives taught by other departments. Students consult with their first-year advisors or with their dissertation supervisors on the most appropriate electives to take for their individualized program. In addition, the Biomedical Sciences program offers Emphasis Areas that can be designated on their transcripts. Each Emphasis Area has a set of electives required to obtain the transcript designation.

Courses not changing: The requirements to take IBGP 8050, Pharm 7510, IBGP 7070, IBGP 7080 and PUBHBIO 6280 will not change. These courses teach laboratory methods, research ethics, two semesters of grant writing, and biostatistics.

Content of Program

The content of the Program will not change; the way the content is taught will change. The content in courses IBGP 7010 and 7020 will be offered in IBGP 7000, but it will no longer focus on teaching facts but rather concepts. Much of what is currently taught in 7010/7020 includes facts that rapidly become outdated and that are not relevant to many of our students. Our program proposes to instead focus on the concepts, and selecting opportunities to dig deep into the details and facts as examples of the research process. Further, the 12 modules that comprise IBGP 7010/7020 will be offered as independent electives that have adapted their curriculum to complement the content in IBGP 7000.

Classroom content will not otherwise change.

Transition Plan

Most of the changes proposed for the program occur in the first year. For students already in the Program, those changes are irrelevant. For the senior level courses and electives, we propose to continue to offer all courses. Which courses are required depends on which year the student entered. Students entering in the
summer of 2012 will have the new elective requirements, and students entering 2011 or earlier will have the old requirements.

**Content of the Electives**

As discussed above, the Biomedical Sciences graduate program offers 37 electives ([Appendix D](#)). Students enroll in electives with the advice of their first year advisor, dissertation supervisor, or emphasis area director.

**Student advising**

On the first day of orientation, each student meets with their first year advisor. This advisor is a member of the GSC, and based on the student’s application has a common research interest. The first year advisor helps the student select faculty for research rotations and to choose courses. Electives will be taken in the spring semester, and the first year advisor helps in those decisions. It is anticipated that almost all of our students after first year will be advised on courses by their dissertation supervisor and by the relevant emphasis area director. These three individuals provide necessary oversight. In addition, the dissertation committee, which is assembled in the second year, can advise the student about needed elective courses.

**New subplans**

Three new emphasis areas are proposed in

- Computational Biology and Bioinformatics;
- Cellular and Molecular Physiology
- Translational Research

Please find attached a letter from the dean of the College of Medicine in support of the subplans ([Appendix F](#)) and the detailed subplans ([Appendices G, H, and I](#)).

Appendix A

IBGP 7000, Biomedical Sciences Graduate Program survey course

This course is not intended as a replacement for the current modules, but as a survey course that includes what the program views as essential for all of its graduates to know before choosing their rotations and/or specializing in an emphasis area. The modules are each on the books as stand-alone courses and can be offered as electives that fill out the gaps left by the survey course.

Biomedical Sciences Survey Course: M-W-F, 8:30 – 10:30 AM

Required for IBGP first year students (fall semester), enrollment by other students only with faculty approval.

Block 1: Fundamental molecular biology (5 weeks / 30 h)
   a. Nucleic Acids (6 hours)
   b. Transcription & Translation (8 hours)
   c. Proteins (8 hours)
   d. Genes & Genomes (8 hours)

Block 2: Cell Biology (4 weeks / 24 hours)
   a. Molecular & Cellular Physiology (6 hours)
   b. Cytoskeleton & Extracellular Matrix (4 hours)
   c. Development (6 hours)
   d. Molecular Pharmacology (4 hours)
   e. Neurobiology (4 hours)

Block 3: Systems (5 weeks / 30 hours)
   a. Immunology (8 hours)
   b. Microbial Pathogenesis (6 hours)
   c. Computational Biology (8 hours)
   d. Experimental Therapeutics (8 hours)

Each block will have one take home test for evaluation.
Appendix B

Proposed changes to IBGP 7040, Research Problem Solving in Biomedical Science

This class is required for all first year IBGP students (spring semester). No other students may enroll.

Class meetings: Tuesdays 5:00-7:00 PM, Wednesdays 5:00-7:00 PM

The modified IBGP 7040 is a discussion class, thus active participation in the small groups is required. Students are assigned papers on Wednesday of the preceding week. Students meet in small groups (3 groups of 10 students) on Tuesday afternoons to work out the paper in the absence of faculty. On Wednesday afternoons the students are organized into two groups of 15 students plus two faculty members. Then the same paper is discussed with the faculty groups. Grading is based on participation in the discussion group. Participation does not necessarily reflect quantity so much as quality; valid participation can take the form of questions or other ways of advancing the discussion.

Attendance is required at all classes (both student groups and faculty groups). If a student must miss a class, the student is obligated to notify the faculty member in advance and must write a paper discussing the research article to be handed in on the Monday following the missed class.

Each week, the paper(s) and relevant supplementary material will appear on the course website. Classrooms will require computers with web access and projectors.

For each paper, the student is expected to read background material in order to learn the context for the finding. The goal of each class is to teach a complete understanding of all aspects of a given paper and to evaluate whether the data support the conclusions.

Proposed IBGP 7040 schedule

Week 1: Assign groups for Tuesdays (students only) and Wednesdays (different students with faculty). Discuss with students what is expected and how you analyze a biomedical research paper. Assign the paper for week 2.

Week 2-7: Students meet on Tuesdays to analyze the paper (Tuesday 5:00-7:00 PM), and the students+faculty groups meet on Wednesday (5:00-7:00 PM) to discuss the same paper.

Week 8-14: The composition of the student and student+faculty groups are shuffled, and the course continues as previously.

Grading: All grades are based on participation. There are no written exams.

</table>

Students may also take classes in other departments such as MVIMG, Neuroscience, Pharmacology, Pathology, MCB. Students that wish to designate an area of research emphasis will have to take additional required courses in order to earn an official designation of that area on their transcript. These required courses are determined by the area of research emphasis leader and listed on the IBGP website. ([www.ibgp.org](http://www.ibgp.org))
May 15, 2012

Dr. Scott Herness  
Associate Dean, Graduate School  
The Ohio State University  
250 University Hall, 230 North Oval Mall  
Columbus, OH 43210-1366

Dear Dr. Herness:

It has come to our attention that three of our Areas of Research Emphasis (Subplans) which have been advertised on our web site, have not been officially approved through the Graduate School. We have a number of students who are currently taking the coursework in pursuit of transcript designation in these areas. These subplans include: 1) Computational Biology and Informatics, 2) Cellular and Molecular Physiology, and 3) Translational Research.

Please find attached detailed information about each Subplan including the learning goals, course requirements, and program rationale statement. We have also provided a letter of support from the Dean of the College of Medicine, Charles Lockwood.

We have one student who has applied to graduate in Spring 2012 who has also applied for transcript designation (Levy Reyes in Translational Research). We understand that these Subplans may not be approved to add the designation to his Spring Quarter 2012 academic record at graduation, but respectfully request that the Translational Research designation be added to his transcript retroactively, once these areas are officially approved.

Please contact Jeff Parvin at parvin.4@osu.edu or 292-0523 with any questions or if you need additional information. Thank you.

Sincerely,

Joanna Groden, Ph.D.  
Associate Dean for Graduate Studies  
Professor and Co-Director, IBGP

RE: IBGP-PH Areas of Research Emphasis (Subplans) for Transcript Designation

Dear Dr. Herness:

We wish to create subplans for transcript designation for IBGP-PH students in the following Areas of Research Emphasis: 1) Computational Biology and Bioinformatics, 2) Cellular and Molecular Physiology, and 3) Translational Research. This request has the full support of the College of Medicine. As the accompanying material will detail, these Subplans allow students to obtain specialized training in these content areas and will add value in terms of making students more marketable for employment in research support positions in biotech industry and in consulting.

Thank you for your attention to this matter.

Sincerely,

[Signature]

Charles J. Lockwood, MD  
Dean, College of Medicine  
Vice President for Health Sciences  
Professor, Obstetrics and Gynecology  
Professor, Leslie H. and Abigail S. Wexner Chair in Medicine
Computational Biology and Bioinformatics

1. Learning Goals

An overarching goal of the Computational Biology and Bioinformatics Area of Research Emphasis is to develop the insights and the technology needed to gather the information needed to quantify biological function and to develop detailed predictive biomedical models. These will be used to accurately describe normal physiological function, to understand mechanisms that underlie pathological processes, to discover new biomarkers and therapeutical targets for diseases, and to evaluate medical and surgical interventions.

Transcript designation in Computational Biology and Bioinformatics can include any of the following: 1) Training in the processing, analysis, mining, and integration of data from multiple sources such as genomic sequencing, epigenetics studies, gene and protein expression profiling, radiological studies, microscopy imagery, electrophysiological experiments, and numerical simulation studies, 2) Development of models to explain physiological and pathological processes, and 3) Development of database technology, data analysis techniques, high performance computing infrastructure, and systems software/middleware needed to carry out tasks associated with the aggregation and analysis of biomedical data, and needed to carry out biomedical simulations.

This Area of Research Emphasis will involve the integration of large-scale data analysis, management, processing, and visualization with biomedical informatics. We will engage trainees in a highly collaborative interdisciplinary research program on high throughput data analysis and integration for biomedical applications in high end computing environment. We will also provide access to a customized program of course work in biomedical informatics, computer science and in basic and translational biomedical sciences.

Faculty members have diverse research interests which span analysis of gene sequence and gene and protein expression data, epigenetics, analysis and modeling of therapeutic and toxic drug effects, computational modeling of physiological systems, biomedical image processing and feature detection, visualization and development of database, data mining and data exploration algorithms and middleware.

2. Course Requirements

Requirements for Students to receive transcript designation in Computational Biology and Bioinformatics: Students will ordinarily be expected to have strong backgrounds in Computer Science and/or undergraduate majors in Computer Science, Engineering, Physics, Chemistry or Biomedical Engineering. However, candidates with weaker preparation in computer science and related fields may pursue this, but if warranted may be required by their dissertation advisory committee to take an additional customized program of coursework.

1. Required Courses

In addition to the IBGP core curriculum, students must complete the following courses:
• **IBGP 7300** (2 credits-letter graded)
  
  *Biomedical Informatics I*: Introduces students to basic topics of bioinformatics including sequence analyses, proteomics, microarrays, regulatory networks, sequence and protein databases.

• **IBGP 7310** (2 credits-letter graded).
  
  *Biomedical Informatics II*: Continuation of Bioinformatics I.

Students will also complete at least one of the following or its equivalent:

- **BMI 5710** – Introduction to Clinical Informatics
- **BMI 5720** – Introduction to Imaging Informatics
- **BMI 5740** – Introduction to Translational Informatics
- **BMI 7830** – Systems Biology
- **CSE 5441** – Introduction to Parallel Computing
  
  *( Converted from quarter course: **CIS 621 Introduction to High Performance Computing**)*
- **CSE 5431** – Systems III: Introduction to Operating Systems
  
  *( Converted from quarter course: **CIS 660 Introduction to Operating Systems**)*
- **CSE 5433** Operating System Laboratory
- **CSE 5421** Introduction to Database Systems
- **CSE 5461** – Computer Networking and Internet Technologies*
- **CSE 5331** – Foundations II: Data Structures and Algorithms**
- **CIS 6441** Parallel Computing
- **CSE 5242** – Advanced Database Management Systems
- **CSE 5542** – Real-Time Rendering
  
  *( Converted from quarter course: **CIS 781 Introduction to 3D Image Generation**)*
- **CSE 5545** – Advanced Computer Graphics
  
  *( Converted from quarter course: **CIS 782 Advanced 3D Image Generation**)*
- **CSE 6331** – Algorithms
- **CSE 5243** – Introduction to Data Mining
- **ECE 7868** – Pattern Recognition and Machine Learning
- **ECE 7005** – Information Theory
- **ECE 7866** – Computer Vision
- **STAT 6410** – Design and Analysis of Experiments
- **STAT 6450** – Applied Regression Analysis
- **STAT 6560** – Applied Multivariate Analysis
- **STAT 6570** – Applied Bayesian Analysis
- **STAT 6625** – Statistical Analysis of Genetic Data
- **STAT 7620** – Elements of Statistical Learning

2. **Seminars**

Due to the interdisciplinary nature of Bioinformatics; relevant seminars are given through Biomedical Informatics, CIS, Biomedical Engineering, and IBGP. To receive the designation of Graduate Specialization in Biomedical Informatics students will be required to register for a total of at least 4 credit hours (i.e., 4 semesters) in these relevant seminars approved by the student’s advisor.

3. **Dissertation Research**

After selection of an advisor, students must register each semester for dissertation research by registering for IBGP 8999.
3. Program Rational Statement

The achievement of an integrated understanding of biological function and interactions between multiple components of a biological system across hierarchical levels of analysis ranging from that of the gene to that of cell, tissue and organ is the next major frontier of biomedical science. Because of the inherent complexity of real biological systems, the development and analysis of computational models based directly on experimental data is necessary to achieve this understanding and translation to clinical practices.
Cellular and Molecular Physiology

1. Learning Goals

Students receiving the special designation of Cellular and Molecular Physiology will focus their training on advanced methods necessary to examine physiological and pathophysiological processes. This training will provide students with an understanding of integrative biological approaches to the analysis of the disease process.

2. Course Requirements

In addition to the IBGP core requirements, for a student to receive on their transcript the special designation of Cellular and Molecular Physiology, he/she must complete a minimum of 4 additional hours of specialized elective course work, at least 2 of which must be from the list of approved elective courses listed below. Up to 2 hours of other elective courses may substitute for the approved courses upon approval of the student’s dissertation advisory committee.

1. Approved Courses

- Neuroscience 7001- Foundations of Neuroscience (6 Credit hours)
- Physiology 6080 – Physiology I (3 credit hours). First of a two-course sequence presenting the application of physiology to the practice of pharmacy.
- Physiology 6101 – Advanced Physiology I (3 credit hours). First in two semester graduate course sequence covering Cell, Neuro, Muscle, Cardiovascular, GI, Respiratory, Renal & Endocrine Physiology.
- Pharmacology 5600 – Introduction to General Pharmacology (2 credit hours). Introduction to the general principles of pharmacology, drug classification, and the sites and mechanisms of drug action.
- Pharmacy 8020 – Advanced Pharmacokinetics (3 credit hours). Coverage of multiple general areas of pre-clinical, clinical, and population pharmacokinetic data analysis, modeling and PK study design.
- PhysioCB 8101 – Advanced Cardiac Physiology (3 credit hours). Faculty give lectures in the field of basic cardiac physiology

2. Seminars

Due to the interdisciplinary nature of Cellular and Molecular Physiology, relevant seminars are given through a variety of departments, centers, and programs (HLRI, IBGP, MCDB, OSBP, and various departmental seminar series), which are relevant. To receive this special graduate designation, students will be required to register for a total of 6 credit hours (i.e. 6 semesters).

3. Dissertation Research

After selection of an advisor, students must register each semester for dissertation research by registering for IBGP 8999.

3. Program Rational Statement
Research in Cellular and Molecular Physiology and Cell Biology is geared towards understanding the mechanisms that contribute to cardiovascular, gastrointestinal, neurological and other organ and systems related diseases. The mechanisms that control physiology can be studied at many levels of complexity ranging from single molecule interactions to social and environmental pressures. As a highly integrated science, physiology uses techniques and ideas from chemistry, mathematics, physics and biology to synthesize, describe and elucidate the fundamental workings of the body. Animal and cellular models are commonly used to investigate human diseases and their progression. In discovering how the cell, organ and body functions, we can identify specific molecular targets required for the development of therapies to treat different human diseases. The cellular and molecular physiology faculty and students participate in research programs conducted in the Spinal Cord Injury Research Center, the Aging Research Center, the Neuroscience Research Center, the Reye's Syndrome Research Center, the Comprehensive Cancer Center, and the Davis Heart and Lung Research Institute.
Translational Research

1. Learning Goals

The IBGP has designed the curriculum described below for students interested in translational research that will extend their time to degree by approximately two semesters. In addition to the IBGP core curriculum, students wishing to obtain a Graduate Specialization Transcript Designation in Translational Research must take the curriculum outlined below, because those wishing to conduct cutting edge translational research must go beyond the material in the core courses and master additional information that is more clinically related. The OSU College of Medicine has all the resources necessary to provide this specialized training. First, there are many excellent faculty members at OSU with expertise in clinically related areas that can provide several highly specialized courses and seminars in which students can obtain this advanced level of training. Second, the independent study courses in Human Medical Science (IBGP-7601) and Human Pathobiology (IBGP-7631) provide a unique resource that covers clinically related materials for all the major organ systems. However, students will take only those that relate most closely to their dissertation research. They will be guided in the most appropriate choices of these courses, independent studies, and seminars by their dissertation advisors, dissertation advisory committees and the Translational Research Liaison.

2. Course Requirements

Students are required to satisfy all of the IBGP course requirements. Most of the core curriculum courses are taken by IBGP students during the first two years. These provide an excellent basis for investigating human disease. In addition to the IBGP core curriculum, for a student to receive the transcript designation in "Translational Research," he/she must complete the following:

1. Required Courses

- **PH-795 (TBD in semesters- course not yet converted to semesters)** Seminar addressing varying topics in clinical and translational research; literature reviews, guest speakers, discussion of issues, student research presentations. This course is graded S/U.
- **IBGP-7602** Independent Studies in Human Histology (2 credits)
- **IBGP-7603** Independent Studies in Human Pathologic Mechanisms (2 credits)
- **IBGP-7700** Introduction to Clinical Aspects of Translational Research (1 credit)
  Through lectures and small group sessions, this course will provide the basic information needed to begin work on hospital wards and in the ambulatory environment for graduate students with an interest in translational research.
- **One Clinical Experiences course of IBGP- 7701-7773** Clinical Experiences for Students in Translational Research
  This course will provide graduate students a clinical experience on hospital wards and in the ambulatory environment in a clinical area related to his/her dissertation research. The student will learn about the clinical presentations of diseases, diagnostic and therapeutic procedures, and social interactions in the clinical environment. Understanding these issues will assist the student to function as a translational researcher by performing experiments to generate information at the interface between basic and clinical research, and to
facilitating the transfer of information in a bidirectional manner between the clinical and basic research environments.

2. Elective Courses

For a student to obtain a Graduate Specialization Transcript Designation in Translational Research, (s)he must take at least one course from the list below that are relevant to the organ system or biological process most closely related to his/her dissertation research. These are in addition to those listed above that are required for all students in Translational Research. A student will choose courses to design a customized curriculum in consultation with the dissertation advisor, dissertation advisory committee, and the Liaison for the Translational Research area of research emphasis.

- **IBGP-7601** Independent Studies in Human Medical Science (2 credits)
- **IBGP-7602** Independent Studies in Medical Biochemistry (2 credits)
- **IBGP-7603** Independent Studies in Human Neuroanatomy (2 credits)
- **IBGP-7604** Independent Studies in Human Neurophysiology (3 credits)
- **IBGP-7605** Independent Studies in the Human Cardiovascular System (2 credits)
- **IBGP-7606** Independent Studies in the Human Respiratory System (2 credits)
- **IBGP-7607** Independent Studies in the Human Urinary System and Body Fluids (2 credits)
- **IBGP-7608** Independent Studies in the Human Gastrointestinal System (2 credits)
- **IBGP-7610** Independent Studies in Human Blood and Lymphatic Tissues (1 credit)
- **IBGP-7611** Independent Studies in Human Immunological Mechanisms (2 credits)
- **IBGP-7612** Independent Studies in Human Medical Nutrition (2 credits)
- **IBGP-7613** Independent Studies in Human Endocrine and Metabolic Systems (2 credits)
- **IBGP-7614** Independent Studies in the Human Reproductive System (2 credits)
- **IBGP-7631** Independent Studies in Human Pathobiology (2 credits)
- **IBGP-7632** Independent Studies in Human Microbial Mechanisms (3 credits)
- **IBGP-7633** Independent Studies in Human Drug Mechanisms (4 credits)
- **IBGP-7634** Independent Studies in Human Infectious Diseases (3 credits)
- **IBGP-7635** Independent Studies in Cardiovascular Pathobiology (4 credits)
- **IBGP-7636** Independent Studies in Respiratory Pathobiology (2 credits)
- **IBGP-7637** Independent Studies in Renal Pathobiology (2 credits)
- **IBGP-7638** Independent Studies in Endocrine Pathobiology (2 credits)
- **IBGP-7639** Independent Studies in Gastrointestinal Pathobiology (2 credits)
- **IBGP-7640** Independent Studies in Reproductive Pathobiology (2 credits)
- **IBGP-7641** Independent Studies in Human Neuro-Pathobiology (2 credits)
- **IBGP-7642** Independent Studies in Psychiatry (1 credit)
- **IBGP-7643** Independent Studies in Hematology Pathobiology (2 credit)
- **IBGP-7644** Independent Studies in Rheumatic and Musculoskeletal Pathobiology (1 credit)
- **IBGP-7645** Independent Studies in Ophthalmic Pathobiology (1 credit)

3. Optional Courses:
• **Anatomy-6193** Individual Studies in Anatomy (1-5 credits)
The goal is to provide a fundamental understanding of the structure of the human body using a systems-based approach and a lecture-laboratory format to build a conceptual framework of the body that will serve as the foundation for subsequent study of pathobiology. A key component of the laboratory exercises will be a comparison of anatomical structures seen in the laboratory with the appearance of those structures in images obtained using conventional radiography, computed tomography, and magnetic resonance. This will provide an anatomical context of the body for understanding microscopic and molecular levels of normal anatomy and of disease processes.

• **Pathology-7793.11** Individual Studies in Pathologic Anatomy (3-18 credits)
The student will participate in one autopsy, including the prosection, preparation of tissues for microscopy, review of histological slides, completion of autopsy report, and presentation at the gross autopsy conference.

• **Radiology-7193.01** Individual Studies in Radiology (1-6 credits)
The student will be assigned to an OSU faculty clinical radiologist who is a subspecialist in an area closely related to the student’s dissertation topic (e.g. neuroradiology, musculoskeletal radiology). The student will attend 10 sessions at which the radiologist interprets images (MRI, CT, X-ray, and other special techniques) on current clinical patients. Appropriate reading materials will be provided.

4. **Dissertation Research**
To be eligible for this graduate specialization transcript designation in Translational Research, the student must have selected an advisor and have defined a dissertation research project that has a translational component to it. Students must register each semester for dissertation research by registering for IBGP 8999.

3. **Program Rational Statement**
The fundamental mission of academic medicine is the acquisition and application of scientific knowledge to improve health care, and the translation of information derived from basic biomedical research into clinical applications is essential for this mission to be accomplished. The importance of this is highlighted by the NIH declaring translational research to be a very high priority in its Roadmap for future funding of research ([http://nihroadmap.nih.gov/](http://nihroadmap.nih.gov/)).
May 18, 2012

Joanna Groden
Jeff Parvin
Co-Directors
Integrated Biomedical Science Graduate Program

Professors Groden and Parvin,

The Graduate School Curriculum Committee (GSCC) recently met and reviewed the submitted proposals for the Integrated Biomedical Sciences Graduate Program. Three requests were considered:

- Title change to Biomedical Sciences
- Proposal for a Master of Science Degree
- Curriculum change for the existing PhD degree

All requests were considered favorably by the committee. However, some clarifications were requested which I outline below. The committee has requested the proposals be revised and resubmitted for subsequent review at an upcoming GSCC meeting.

- **TITLE CHANGE**
  - The title change was viewed favorably. Any title change to an existing program requires approval at both University and statewide levels. With prior approval at CAA, the title change will be sent to the Ohio Board of Regents separately. As I’m sure you know, the semester conversion process served as a catalyst for reexamination by many programs. Among the results of these reevaluations were a substantial number of title changes. To facilitate the statewide approval process, Vice Chancellor Stephanie Davidson has given OSU permission to bundle all our title changes into a single request. Given the breadth of these changes and the need to be comprehensive, the list has yet to be submitted to the Ohio Board of Regents. We will have the opportunity to include the title change of the IBGP on this list.

- **MASTER’S DEGREE**
  - The addition of a Master’s of Science degree to the Integrated Biomedical Sciences Graduate Program was viewed favorably. As this is a new degree, it will require both University (Board of Trustees) and statewide (Board of Regents) approval. The Curriculum committee has requested some minor clarifications and asked that the proposal be returned for its reconsideration. Additionally, in preparation for its ultimate submission to the Ohio Board
of Regents, the proposal should be submitted in the Program Development Plan format. I’ve previously forwarded the relevant sections of the Regents Guidelines which describe the Program Development Plan.

- As the Master’s degree will be a default degree for students not passing successfully to the PhD, description of the minimum requirements for the Master’s needs to be better stated.
  - What are the criteria are used to judge the student receiving a terminal Masters?
  - Where does the candidacy exam occur in this sequence? What are its requirements and how is the exam administered?
  - Since the students will not be producing a thesis, requirements for the non-thesis option need to be described. What exactly substitutes for a thesis?
  - Clarification is needed for individual studies 7930, e.g. when does it occur in the student’s curriculum and what does it entail.

- The PDP needs to be more fully developed for its ultimate submission to Regents Advisory Board on Graduate Education (RACGS). Two recently submitted PDPs are attached as examples.

- PhD
  - This proposal outlines curricular changes to the previously approved PhD semester curriculum. A side by side chart of the proposed and approved semester courses, including their timing, would be helpful. Only a table comparing quarter and semester courses was provided. Further, seminar courses seemed to be collapsed into a single description. It would be more helpful to see these courses individually as they appear in the curriculum.
  - Concern was expressed that with elimination of two core courses (7010 and 7020) and the added flexibility of electives, essential content of the program could potentially be missed by students. A more detailed narrative would be helpful.
  - The transition plan for existing students is weak, i.e. how existing students transition from the existing quarter curriculum to this proposed semester curriculum.
  - Since the change will allow students more flexibility by providing more content in electives, a more comprehensive listing of electives from which the student may choose would be helpful.
  - How is the student advised? Who approves the student’s curriculum – the advisor, the student’s committee, the Graduate Studies committee? Where does the oversight for the flexibility lie? Is there oversight for an advisor’s decisions?

Finally, I understand that an additional change to the IBGP program is planned for submission to the PACER system that involves three new subplans: 1) Computational Biology and Informatics, 2) Cellular and Molecular Physiology, and 3) Translational Research. If this is true, please combine these changes and the curricular changes described above into a single proposal. The Master’s program should remain as a separate Program Development Plan.
Our next scheduled meeting of the Graduate School Curriculum Committee is June 4. If proposals are submitted approximately one week prior to that date, we would be able to add these reviews to that agenda.

Please don’t hesitate to contact me with questions or clarifications.

Many thanks,

Scott Herness

Advancing graduate education for over 100 years
June 15, 2012

Joanna Groden
Jeff Parvin
Co-Directors
Integrated Biomedical Science Graduate Program

Professors Groden and Parvin,

The Graduate School Curriculum Committee (GSCC) recently met and reviewed the revised proposals for the Integrated Biomedical Sciences Graduate Program submitted in response to the GSCC comments of May 18th.

The committee felt the revised proposals adequately clarified their previous queries. However, new information submitted in these proposals precipitated a few new questions.

- **MASTER’s DEGREE**
  - It is now clear that this is a thesis-based Master’s degree and that the candidacy exam will be used as one among several discriminators (e.g. student performance in courses and lab) to decide whether the student will move forward to the PhD. A concern was expressed about the scenario, should it arise, for a pre-candidacy student who, based on discriminators other than the Candidacy exam, is not progressing to the PhD. Since the Candidacy Exam is not required for a Master’s degree by the Graduate School, this student might be eligible for a thesis, if sufficiently advanced in his/her research, though s/he would be ineligible for the Master’s based on the programs’ rules. Is this the intent?

  - The new section added on the Candidacy Exam contains possible misconceptions/errors that should be clarified prior to the degree moving forward in the approval process.

The candidacy exam is often misunderstood as two exams, a written and an oral, each receiving a pass or fail grade. It is not. The candidacy exam is one exam composed of two portions with a single satisfactory/unsatisfactory evaluation which encompasses the collective performance on both sections. (Guidelines on the Candidacy Exam may be found in Section VII.4 of the Graduate Handbook.) The description in the proposal describes two exams, each with an independent result, and each which can apparently be re-taken independent of the other.
Students are allowed two attempts at the Candidacy Exam, not two attempts at the written and two attempts at the oral. In this student’s first attempt at the Candidacy Exam, if s/he does not produce a satisfactory written portion of the candidacy exam, s/he could request to move forward to the oral portion as it is possible that the student’s performance on the oral portion of the exam could redeem his/her performance on the written portion. If the student waives that right then the first attempt would be considered a failed attempt, which should be registered with the Graduate School. This differs from the scenario where the student attempts the written portion twice before ever moving forward to the oral exam.

Additionally, the statement that the advisor does not participate in the oral portion of the candidacy exam is puzzling. (The assumption is that this is the Research/Dissertation advisor, as opposed to an academic advisor). From the Graduate School’s perspective there is one Candidacy Committee formed for the single candidacy exam. The expectation is that the entire committee participates in the entire exam. Can you clarify?

- PhD
  - SEMINAR SERIES – it appears as if all the seminar series have been eliminated from the new curriculum as no seminar series is listed in the new IBGP curriculum. The GSCC felt it doubtful that students in this program do not participate in a seminar series.

  - Three new specializations have been added to the IBGP program for approval:
    - Computational Biology and Informatics,
    - Cellular and Molecular Physiology
    - Translational Research
  
  Other than a humorous typographical error (‘Rational’ rather than ‘Rationale’ Statement), the specializations were viewed favorably.

Pending clarifications, the Master’s degrees will be able to move forward to Graduate Council for the next step in the approval process. The changes to the PhD degree will next move to CAA. CAA will be having a meeting in July (at present unscheduled).

Please don’t hesitate to contact me with questions or clarifications.

Many thanks,

Scott Herness

Program Learning Goals

Note: these are required for all undergraduate degree programs and majors now, and will be required for all graduate and professional degree programs in 2012. Nonetheless, all programs are encouraged to complete these now.

Program Learning Goals

- This graduate program trains students to investigate human disease through a process of integrating information across several traditional biomedical research disciplines.
- Our graduates will possess a breadth of understanding for the mechanisms underlying human disease, which coupled with intensive integrative research training, positions our graduates for success in a wide range of career opportunities.
- Our graduates will possess a breadth of understanding for the mechanisms underlying human disease, which coupled with intensive integrative research training, positions our graduates for success in a wide range of career opportunities.
- Combine mentored laboratory research with a rigorous and modern curriculum
- Provide training in professional development and ethics using lectures, workshops, and seminars.
- Students will receive specialized training in areas of choice related to the students thesis work using classes and laboratory training.

Assessment
Assessment plan includes student learning goals, how those goals are evaluated, and how the information collected is used to improve student learning. An assessment plan is required for undergraduate majors and degrees. Graduate and professional degree programs are encouraged to complete this now, but will not be required to do so until 2012.

Is this a degree program (undergraduate, graduate, or professional) or major proposal? Yes

Does the degree program or major have an assessment plan on file with the university Office of Academic Affairs? No

Program Specializations/Sub-Plans

If you do not specify a program specialization/sub-plan it will be assumed you are submitting this program for all program specializations/sub-plans.

Pre-Major

Does this Program have a Pre-Major? No

January 10, 2011

Dr. Catherine R. Lucey, MD, FACD
Interim Dean, College of Medicine
Vice Dean for Education

Dear Dr. Lucey:

The IBGP is led by a Director and Associate Director who meet regularly (often biweekly) with the Graduate Studies Committee (GSC). The GSC is composed of two representatives from each of the basic science Departments in the College of Medicine. The governance of the IBGP is in keeping with the rules set forth in our handbook. Accordingly, many major decisions on policy, admissions, and student matters are made by a vote of the GSC. The IBGP Program manager runs the day-to-day operations of the IBGP. The conversion of the IBGP courses from quarters to semesters was managed by the Associate Director in consultation with the Director, Program Manager and the GSC. All have worked together on the various steps and will continue to work together to answer questions and make any adjustments needed to make sure the conversion process is completed smoothly. Some faculty input was received. Our only changes were quarter to semester conversions. The IBGP GSC voted unanimously to approve the changes. Thank you for all of your hard work in this process and let us know how else we may facilitate the smooth transition with minimal disruptions for our students.

Sincerely,

R. Thomas Boyd, Ph.D
Associate Director, Integrated Biomedical Science Graduate Program
Associate Professor of Neuroscience
Department of Neuroscience
614 292-4391
Boyd.16@osu.edu
Program Rationale

The theme of the Integrated Biomedical Science Graduate Program (IBGP) is "The Biology of Human Disease." This graduate program trains students to investigate human disease through a process of integrating information across several traditional biomedical research disciplines. Our graduates possess a breadth of understanding for the mechanisms underlying human disease, which coupled with intensive integrative research training, positions our graduates for success in a wide range of career opportunities.

The College of Medicine has provided an exceptional training environment for the IBGP, which includes a commitment to provide total stipend, tuition, and fees for all incoming IBGP students for their first year, commitment to dedicated space for all IBGP educational, student, and administrative activities, and a yearly budget that demonstrates the College’s commitment to diversity recruitment and retention, as well as to career development.

The IBGP curriculum is being converted to semesters with no changes in the courses other than course hours and the conversion of our core course from 3 quarters to 2 semesters (Biology of Human Disease).

Program Goals

This graduate program trains students to investigate human disease through a process of integrating information across several traditional biomedical research disciplines.

Our graduates will possess a breadth of understanding for the mechanisms underlying human disease, which coupled with intensive integrative research training, positions our graduates for success in a wide range of career opportunities.

Prepare our students to be independent researchers in academic, industrial, and in government settings.

Combine mentored laboratory research with a rigorous and modern curriculum

Provide training in professional development and ethics using lectures, workshops, and seminars.

Students will receive specialized training in areas of choice related to the students thesis work using classes and laboratory training.

Transition Policy:

The IBGP will closely monitor each students progress and make certain that no delays in time to graduation result due to the conversion process. As is our current policy, the Directors will meet individually with every student each year to make certain that the student is progressing toward the Ph.D. and is being properly trained as a scientist.
